

# Standard Operating Procedure

## Producing a Monthly Digital Assets & Crypto Risk Outlook Slide in Manus

**Document purpose.** This SOP explains how to create, operate, validate and improve a reusable Manus skill that produces a single, evidence-led PowerPoint-compatible slide for a monthly Digital Assets & Crypto Risk Outlook. It is written for a person who can create a Manus account and submit prompts, but who has not previously created a Manus skill or slide.

**Deliverable.** The completed monthly run produces one 16:9 executive slide, speaker notes containing the Internal evidence register, a claim ledger, a source register, market-data calculation records, a run manifest and a quality record. The slide is the executive deliverable. The other artefacts establish traceability and support review.

**Operating principle.** Do not start with slide writing. Fix the reporting window, research and validate evidence, build the claim ledger, write concise content, generate the slide, inspect the rendered result and only then deliver it.

| Document owner          | Digital Assets / Cyber Risk Intelligence owner                                                                                        |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Intended users          | Cyber risk intelligence, operational risk, financial-crime risk, market risk, digital-assets governance and executive reporting teams |
| Default output          | One PowerPoint-compatible, 16:9 monthly slide                                                                                         |
| Default audience        | Senior banking management and Risk Committee stakeholders                                                                             |
| Evidence cut-off        | The run timestamp, unless a different cut-off is instructed                                                                           |
| Recommended run cadence | First business day of each month after the previous month closes                                                                      |
| Delivery boundary       | Deliver within Manus unless the user explicitly authorises another destination                                                        |

# 1. What You Need Before Starting

## 1.1 Minimum prerequisites

Create a Manus account, open a new task and ensure that you can upload reference material and download a completed slide card. No local coding environment is required from the human user. Manus performs research, file creation, calculations and presentation generation inside its working environment.

Provide internal inputs when they are available. These inputs increase decision usefulness but are not required to produce a market-and-external-risk outlook. If they are unavailable, the slide must state `ASSESSMENT REQUIRED` rather than inventing an institution-specific result.

| Input                     | Required? | Why it matters                                     | Example                                            |
|---------------------------|-----------|----------------------------------------------------|----------------------------------------------------|
| Reporting period          | Yes       | Defines which events can be retained               | 1 July 2026 to 31 August 2026                      |
| Geography                 | Yes       | Defines regulatory and market relevance            | Global banking exposure or named jurisdictions     |
| Sector                    | Yes       | Defines the materiality lens                       | Digital assets and crypto                          |
| Slide count               | Yes       | Prevents a one-slide brief becoming a deck         | One connected slide                                |
| Internal risk appetite    | Optional  | Supports a firm-specific RAF conclusion            | Approved custodial concentration limit             |
| Internal exposure metrics | Optional  | Supports quantified firm-specific risk translation | Provider dependency, client assets, collateral use |
| Approved slide example    | Optional  | Provides density, hierarchy and tone reference     | A prior monthly outlook image or PPTX              |

## 1.2 Installable skill architecture

A Manus skill is a reusable instruction package. It contains one required `SKILL.md` file and may also include small scripts, references and templates. The skill should give Manus only

the specialised process controls that would not be reliably repeated from a short user prompt.

Plain Text

```
monthly-digital-assets-crypto-risk-outlook/  
├── SKILL.md # Required workflow and quality gates  
├── scripts/  
│   └── check_visible_slide_controls.py  
├── references/  
│   ├── slide-layout.md  
│   ├── run-playbook.md  
│   └── source-hierarchy.md  
└── templates/  
    ├── claim-ledger-template.md  
    ├── evidence-register-template.md  
    └── monthly-run-prompt.md
```

Keep SKILL.md concise and imperative. Put repeatable logic in scripts, detailed layouts and evidence rules in references/ , and boilerplate files in templates/ . Do not keep the same instructions in both SKILL.md and a reference file.

## 2. Create the Reusable Skills

### 2.1 Skills to create

Create the following two skills first. A third style-reference skill is optional if the organisation uses a stable visual standard.

| Skill                                      | Function                                                                                 | Trigger examples                             |
|--------------------------------------------|------------------------------------------------------------------------------------------|----------------------------------------------|
| monthly-digital-assets-crypto-risk-outlook | Produces the one-slide monthly external outlook and internal evidence trail              | Run the July 2026 outlook                    |
| risk-committee-writing-controls            | Applies mandatory executive-risk language controls across slides, notes and artefacts    | Check the monthly outlook language           |
| digital-assets-executive-slide-style       | Optional. Holds visual hierarchy and tone rules derived from an approved reference slide | Apply the approved three-column visual style |

## 2.2 Ask Manus to create a skill package

Open a new Manus task and submit the following prompt. Replace bracketed text only where it is relevant. Do not edit technical folders yourself unless you are comfortable doing so; Manus can create, test and package the skill.

Plain Text

```
Create a reusable Manus skill named `monthly-digital-assets-crypto-risk-outlook`

Purpose: produce one evidence-led, PowerPoint-compatible 16:9 executive slide for [redacted]

Required sections: title, 25-35 word executive conclusion, Market Vital Signs, [redacted]

Required workflow: set reporting window; research six streams; build a source risk [redacted]

Required controls: retain primary-source evidence; distinguish observed facts from [redacted]

Create a concise SKILL.md, a run-playbook reference, a slide-layout reference, [redacted]
```

Manus should initialise a directory in the skills area, create the required frontmatter, add the resources, execute the package validator and return the resulting skill attachment. In the Manus interface, select **Add to My Skills** on the attachment. The skill is then available in future tasks.

## 2.3 Required frontmatter and master-skill content

The following is the minimum functional skeleton for the master skill. It is not a complete production file. Expand it with your organisation's jurisdiction, source hierarchy and design requirements.

Markdown

```
---
name: monthly-digital-assets-crypto-risk-outlook
description: Produce a source-supported, one-slide monthly Digital Assets and C
---

# Purpose
Produce one 16:9 PowerPoint-compatible executive slide for the required reporti

# Workflow
1. Set the reporting window and evidence cut-off.
```

2. Read ``references/run-playbook.md`` and ``references/slide-layout.md``.
3. Research six streams in parallel.
4. Build and validate the source register and claim ledger.
5. Calculate source-supported charts.
6. Draft slide content and speaker notes.
7. Generate the slide.
8. Run the language checker and visible-slide checker.
9. Render, inspect and deliver only after all gates pass.

#### # Mandatory controls

- Use primary sources where available.
- Distinguish observed facts, assessed implications and scenarios.
- Mark proposals, consultations, implementation actions, effective rules and en
- Keep sources and dates in speaker notes, not on the slide.
- Use ``ASSESSMENT REQUIRED`` when firm-specific data are unavailable.

## 2.4 Create the writing-controls skill

Use a separate writing-controls skill because language rules should apply consistently across all executive risk materials, not only digital-assets slides. The controls should include: concise executive language; evidence-led wording; no em dash character; a short list of restricted severity descriptors; separation of facts from assessment; and a deterministic language scan that must pass before slide delivery.

Use this creation prompt:

Plain Text

Create a Manus skill named ``risk-committee-writing-controls`` for governance-fac.

## 2.5 Build a style reference without copying content

An approved example is a design and communication reference, not evidence. Upload the example and state exactly what should be replicated: title hierarchy, three-column structure, panel density, use of bold metrics, chart placement, icon treatment and impersonal tone. Do not copy claims, numbers, sources or branding from the example unless they apply to the new reporting month.

Use this prompt:

Plain Text

Analyse the attached approved reference slide. Extract its visual structure, in

# 3. Start a Monthly Run

## 3.1 Create the run charter

Open a new Manus task. Invoke the installed skill by writing its slash name, then use a short instruction that fixes the report period. If you require two months on one slide, explicitly write both dates and state that all stories must form one connected narrative.

Plain Text

```
/monthly-digital-assets-crypto-risk-outlook
/risk-committee-writing-controls

Produce one connected slide for 1 July 2026 to 31 August 2026.
Sector: digital assets and crypto.
Geography: global banking exposure.
Slide count: one.
Evidence cut-off: 1 September 2026, GMT+1.
Use the approved three-column editorial style. Keep the tone direct, informative.
```

Manus should first confirm the scope and research inputs, not draft the slide. The confirmation should include period, geography, sector, evidence cut-off, delivery format, a case study only if requested, and the research streams.

| Run-charter field | Required value                      | If missing                                                         |
|-------------------|-------------------------------------|--------------------------------------------------------------------|
| Period            | Full start and end date             | Stop and ask, or mark <code>NEEDS_REVIEW</code>                    |
| Time zone         | User time zone                      | Use the user’ s stated local zone, not an assumed market time zone |
| Cut-off           | Date and time after the period ends | State it in notes and manifest                                     |
| Geography         | Global or named jurisdictions       | Do not infer jurisdiction-specific requirements                    |
| Output            | One slide or defined deck length    | Follow the explicit request                                        |
| Internal inputs   | RAF, control limits, exposures      | Use <code>ASSESSMENT_REQUIRED</code> if absent                     |

## 3.2 Establish dated workspace and artefacts

Manus should use an idempotent, date-stamped workspace. This prevents one month's evidence from being overwritten by a later run.

Plain Text

```
Digital_Asset_Crypto_Risk_Outlook_2026_07_08/  
├─ run_manifest_2026_07_08.md  
├─ source_register_2026_07_08.md  
├─ claim_ledger_2026_07_08.md  
├─ market_data_raw/  
├─ market_data_calculation_2026_07_08.md  
├─ slide_specification_2026_07_08.md  
├─ quality_record_2026_07_08.md  
└─ presentation/  
    ├─ slide.xml  
    └─ slide_notes.md
```

**Minimum run-manifest fields:** reporting period, time zone, run timestamp, evidence cut-off, working scope, internal inputs provided, files created, validation status, exclusions, corrections, final slide location and delivery location.

## 4. Research the Six Mandatory Streams

Research in parallel only after the list of streams has been confirmed. The purpose is to identify candidates, not to decide that every item belongs on the slide.

| Stream                          | Research question                                                                       | Prefer                                                           | Exclude unless independently supported                         |
|---------------------------------|-----------------------------------------------------------------------------------------|------------------------------------------------------------------|----------------------------------------------------------------|
| Market vital signs              | What changed in BTC and ETH, flows, liquidity, leverage, stablecoins and concentration? | Transparent exchange, index, issuer, fund or infrastructure data | Price predictions, influencer commentary, isolated token moves |
| Operational and protocol events | Which custodial, exchange, wallet, bridge, DeFi, key, oracle, settlement or             | Incident post-mortems, victim disclosures, law                   | Undated social posts and unattributed loss claims              |

|                                 |                                                                                                                                     |                                                                                                      |                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|-------------------------------------------------------|
|                                 | smart-contract events were material?                                                                                                | enforcement and official notices                                                                     |                                                       |
| Illicit finance and geopolitics | Which fraud, sanctions, ransomware, mixer, money-laundering or state-linked developments altered exposure?                          | Sanctions authorities, law enforcement, FATF, court records and official intelligence releases       | Claims based only on media headlines                  |
| Institutional infrastructure    | Which changes affected tokenised deposits, stablecoins, ETFs, custody, settlement, market infrastructure or third-party dependence? | Central banks, issuers, audited disclosures and official infrastructure notices                      | Promotional announcements without operational detail  |
| Regulatory mandates             | What changed in licensing, stablecoins, conduct, custody, AML/CFT, travel rule, prudential treatment, enforcement or consultations? | Regulators, central banks, legislatures and official registers                                       | Commentary without an authoritative rule or action    |
| AI-linked digital-assets risk   | What changed in AI-enabled fraud, synthetic identity, automated exploitation or market manipulation?                                | Regulators, law enforcement, CERTs, official platform notices and high-quality intelligence research | Generic AI news without a digital-assets risk pathway |

## 4.1 Apply the source hierarchy

A source must support the exact factual statement used in the slide. Prefer the highest tier that exists.

| Tier | Source types                                                                                                                     | Use                                                   |
|------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|
| 1    | Regulators, central banks, legislatures, sanctions authorities, courts, law enforcement, official issuer notices, protocol post- | Primary evidence for retained claims and chart values |

|   |                                                                                                             |                                                               |
|---|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
|   | mortems, transparent raw market-data endpoints                                                              |                                                               |
| 2 | Audited issuer disclosures, reputable specialist data providers with methodology, counterpart announcements | Corroboration or primary evidence where tier 1 does not exist |
| 3 | Reputable press, research and analysis                                                                      | Context, discovery and corroboration only                     |
| 4 | Unattributed social media, promotional content, undated blogs                                               | Discovery only. Do not retain as evidence.                    |

For a provider self-disclosure, record that it is a provider disclosure and seek independent corroboration where the claim is material. Do not turn a provider statement into a generic market fact.

## 4.2 Record the source register

Create the source register while researching. Record both the event date and publication date if they differ. The following template can be used in Markdown or a spreadsheet.

| Finding ID   | Topic  | Event date  | Publication date | Publisher         | Tier | Source UR |
|--------------|--------|-------------|------------------|-------------------|------|-----------|
| DA-202607-01 | Market | 31 Jul 2026 | 1 Aug 2026       | Transparent venue | 1    | URL       |

## 4.3 Perform a prior-period correction search

Search for later source disclosures that describe an event occurring in the reporting month but published after the previous slide was delivered. Record every correction search in the notes. If a correction changes an executive conclusion, highlighted metric or regulatory status, rerun the slide manually and replace the prior version.

# 5. Validate and Select Claims

## 5.1 Build the claim ledger before drafting

A claim ledger converts raw research into decision-ready slide content. Each candidate must have a clear retain, support-only or exclude decision. Do not write slide prose from browser snippets, source titles or early research notes.

| Field                          | Required entry                                                                                                                                                                     |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Finding ID                     | DA-YYYYMM-01 onwards                                                                                                                                                               |
| Topic                          | Market, operational, illicit finance, infrastructure, regulatory or AI-linked                                                                                                      |
| Event date                     | Occurrence, disclosure or effective date, clearly distinguished                                                                                                                    |
| Publication date               | Source publication date                                                                                                                                                            |
| Evidence                       | Exact source-supported fact, publisher, URL and source tier                                                                                                                        |
| Materiality                    | Shared dependency, high-value or cross-platform loss, market dislocation, custody or collateral pathway, regulatory change, cross-border reach or operational-resilience relevance |
| Operational vulnerability      | Control or business-service weakness exposed                                                                                                                                       |
| Systemic pathway               | Concentration, common provider, liquidity, settlement, collateral or cross-border transmission channel                                                                             |
| Regulatory or financial impact | Impact that the source establishes or a clearly separated analytical implication                                                                                                   |
| Status                         | Observed fact, PROPOSAL , CONSULTATION , IMPLEMENTATION , EFFECTIVE or ENFORCEMENT                                                                                                 |
| Limitation                     | Scope, source-quality or calculation limitation                                                                                                                                    |

Slide decision

Retain, supporting context or exclude, with reason

## 5.2 Use a hard acceptance rule

Retain a material fact only when it has either one authoritative source or two independent credible sources. If two sources conflict, use the primary source as the factual basis and record the conflict in the ledger. Remove a claim when its date, metric, legal status or wording cannot be supported.

**Do not infer a bank impact from an external event.** State the observed event separately from any organisational implication. Use **ASSESSMENT REQUIRED** when the conclusion depends on internal exposures, risk limits or control performance that have not been supplied.

## 5.3 Validate regulatory classification

Regulatory labels are part of the factual content. Treat them as a separate quality gate.

| Source status                          | Permitted visible label                | What may be said                                                                              |
|----------------------------------------|----------------------------------------|-----------------------------------------------------------------------------------------------|
| Draft rule or notice seeking comment   | <b>PROPOSAL</b> or <b>CONSULTATION</b> | The authority proposed or consulted on specified measures. Do not say the measure is binding. |
| Final rule with future start date      | <b>IMPLEMENTATION</b>                  | The final rule has been issued and implementation actions or deadlines apply.                 |
| In-force requirement                   | <b>EFFECTIVE</b>                       | The rule or requirement is in force.                                                          |
| Court, regulator or enforcement action | <b>ENFORCEMENT</b>                     | State only what the order, action or release actually establishes.                            |

## 5.4 Reproduce every market chart from raw data

Use transparent raw data or a provider that documents its methodology. Keep the raw pull, date range, calculation formula and output table. Do not hand-type chart values.

Example method for BTC and ETH indexed chart:

Plain Text

Data period: 1 July 2026 00:00 UTC to 31 August 2026 23:59 UTC

Field: Daily close for BTC-USD and ETH-USD

Index formula: (daily close / close on first reporting-day) × 100

Return formula: (close on final reporting-day / close on first reporting-day - 1) × 100

Validation prompt:

Plain Text

Retrieve a fresh copy of the raw daily candle series used by the slide. Recalculate the indexed series.

A venue-level series must carry a limitation in the speaker notes, for example: Single-venue USD pair; not a consolidated global index or a market-liquidity measure.

## 6. Draft the Slide Content

### 6.1 Separate the hidden analytical chain from visible wording

The underlying analysis should always follow the same sequence. The visible slide should present direct, impersonal prose without process labels unless the user explicitly requests them.

| Internal analytical chain         | Visible expression                                                                     |
|-----------------------------------|----------------------------------------------------------------------------------------|
| Observed event                    | State the source-supported event in one sentence.                                      |
| Operational vulnerability         | State the affected service, process, control or dependency.                            |
| Systemic pathway                  | State the common provider, liquidity, collateral, settlement or cross-border route.    |
| Financial or regulatory relevance | State the decision condition or control expectation, not an unsupported loss forecast. |

Example conversion.

| Avoid                                                  | Use                                                                                                               |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| 2LoD assessment: a failure could create material risk. | The standard rollback path depended on the affected gateway, requiring a separate recovery route.                 |
| Regulators will impose the proposal.                   | PROPOSAL: the authority proposed rules for payment-stablecoin issuance, offering and sale.                        |
| The incident was bad for the market.                   | The event disrupted transfers, card activity and institutional settlement, exposing a shared recovery dependency. |

6.2 Use the required three-column structure

The example below establishes the content architecture. It does not provide the underlying evidence; every entry must already have a claim-ledger record.

| Zone                 | Required content                                                                                    | Design treatment                                                        |
|----------------------|-----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| Title                | Digital Assets & Crypto Risk Outlook:<br>[MONTH YEAR]                                               | Top left, large dark text, period after colon only                      |
| Executive conclusion | 25-35 words, explains risk posture, central exposure and management response                        | Full-width band beneath title, emerald left rule                        |
| Market Vital Signs   | Three stacked panels with two or three source-supported native charts                               | Left column; two or three prominent metrics maximum on full slide       |
| Key Trends           | Three stacked panels for operational, infrastructure, fraud, geopolitical or AI-linked developments | Centre column; direct causal prose and a simple line icon where helpful |
| Regulatory Mandates  | Two or three status-labelled rules, actions or enforcement outcomes                                 | Right column; legal status visible and correct                          |
| Speaker notes        | Internal evidence register with all URLs, sources, dates, definitions, limitations and corrections  | Not visible on slide                                                    |

## 6.3 Copy limits and density control

The slide must be dense enough to support executive scanning without becoming unreadable.

| Element              | Control                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Executive conclusion | 25-35 words                                                                                                                                                      |
| Market panel         | 30-40 words plus chart or metric                                                                                                                                 |
| Key Trend panel      | 35-45 words                                                                                                                                                      |
| Regulatory panel     | 30-40 words                                                                                                                                                      |
| Prominent figures    | Maximum three on the full slide                                                                                                                                  |
| Body text            | At least 12px, normally 13-15px                                                                                                                                  |
| Design               | White canvas, dark text, emerald #00875A , thin grey dividers, clean sans-serif font such as Inter                                                               |
| Exclusions           | No visible sources, URLs, source dates, evidence cut-off, committee labels, slide numbers, footers, watermark, gradient, decorative texture or stock photography |

## 6.4 Use the approved editorial tone

Use short nouns, causal verbs and direct sentences. The tone must be impersonal. Avoid conversational transitions, general warnings and process labels that do not help the executive reader.

| Preferred pattern               | Example                                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Fact, then consequence          | A configuration update interrupted transfers and settlement. The standard rollback path relied on the affected gateway. |
| Regulatory status, then content | PROPOSAL: Treasury issued a notice on payment-stablecoin issuance, offering and sale.                                   |

|                                             |                                                                                            |
|---------------------------------------------|--------------------------------------------------------------------------------------------|
| Metric, then boundary                       | BTC +31.02%. Coinbase Exchange daily UTC close; single-venue limitation retained in notes. |
| Infrastructure development, then dependency | A planned tokenised-deposit connection extends cross-border routing dependencies.          |

# 7. Generate the PowerPoint-Compatible Slide

## 7.1 Instruct Manus to initialise the slide project

Use the following prompt after the claim ledger, content draft, market calculations and evidence register have passed review.

|                                                                                 |
|---------------------------------------------------------------------------------|
| Plain Text                                                                      |
| Create a one-slide 16:9 PowerPoint-compatible presentation using the attached a |

Manus should initialise the presentation once, create the slide XML, add notes, run the output checks and render the presentation. If the visual result has excessive empty space, do not merely enlarge text. Rebalance the grid: increase chart size, redistribute panels, add an evidence-supported chart or visual anchor, and align the lower edges of all three columns.

## 7.2 Authoring rules for PPTX-compatible XML

If you are instructing Manus to write slide XML directly, it must use the presentation project’ s existing design variables and valid XML elements. A standard 16:9 canvas is 1280 by 720 pixels. Each content element requires a short, semantic unique ID.

| Rule       | Required treatment                                                       |
|------------|--------------------------------------------------------------------------|
| Background | Exactly one background element per slide                                 |
| IDs        | Every text, shape, image, icon, table and chart has a unique semantic ID |
| Canvas     | Every object remains within 1280 by 720 pixels                           |

|         |                                                                              |
|---------|------------------------------------------------------------------------------|
| Text    | Use valid inline tags only; use separate paragraph tags for line breaks      |
| Charts  | Use native chart elements with the source-supported data series              |
| Icons   | Use one-colour outline icons sparingly as visual anchors                     |
| Layout  | Use vertical dividers between columns and horizontal dividers between panels |
| Overlap | Allow only deliberate overlay, such as text on a background shape            |

## 7.3 Speaker notes standard

The notes must begin with `Internal evidence register` and contain enough information for a reviewer to reproduce every material claim. Keep notes concise but complete.

Markdown

```
## Internal evidence register
```

```
**Reporting window:** 1 July 2026 to 31 August 2026.
```

```
**Evidence cut-off:** 1 September 2026, GMT+1.
```

```
**Prior-period correction:** None identified.
```

```
| Finding ID | Visible claim | Source URL | Event / publication date | Calculat
|---|---|---|---|---|---|
| DA-202607-01 | BTC +31.02% | [URL] | 1 Jul / 31 Aug 2026 | (final close / ope
| DA-202607-02 | Service interruption | [URL] | 14 / 21 Jul 2026 | Provider pos
```

Do not place the register on the visible slide. Confirm that the notes refer to the final data and wording, not an earlier draft.

## 8. Quality Assurance and Delivery

### 8.1 Run all gates in order

Do not deliver if any gate fails. Correct the underlying work product, rerun the relevant check and retain the quality record.

| Gate                      | Test                                         | Pass condition                                                                                         | Failure response                              |
|---------------------------|----------------------------------------------|--------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| Period                    | Compare every event date to reporting window | In-period event or explicit prior-period correction                                                    | Remove, relabel or move to correction notes   |
| Evidence                  | Compare visible wording to source document   | One authoritative source or two independent credible sources                                           | Rewrite or remove                             |
| Metric                    | Reproduce raw series and calculations        | Definition, source, unit, as-of date and values all match                                              | Recalculate and update chart, slide and notes |
| Materiality               | Test banking-relevant pathway                | Shared dependency, control impact, market, liquidity, custody, regulatory or financial-crime relevance | Exclude low-value information                 |
| Regulatory classification | Compare visible label to legal source        | Proposal, consultation, implementation, effective and enforcement status match                         | Reclassify or remove                          |
| Language                  | Scan draft, slide XML and notes              | Writing-control script passes                                                                          | Rewrite prohibited or rhetorical wording      |
| Slide content             | Inspect four required zones                  | One slide, title, conclusion, three columns, charts and no sources on-slide                            | Rebuild layout                                |
| Traceability              | Inspect notes and workspace                  | Sources, dates, limitations, calculations and corrections recorded                                     | Complete register                             |

|        |                         |                                                                                                     |                                 |
|--------|-------------------------|-----------------------------------------------------------------------------------------------------|---------------------------------|
| Render | Inspect generated slide | No overflow, clipping, unreadable text or off-canvas objects; columns have comparable visual weight | Adjust coordinates and rerender |
|--------|-------------------------|-----------------------------------------------------------------------------------------------------|---------------------------------|

## 8.2 Mandatory commands for Manus to run

Tell Manus to run these checks before presentation. Substitute the actual file paths.

Bash

```
python /home/ubuntu/skills/risk-committee-writing-controls/scripts/check_language
/path/to/slide_specification.md \
/path/to/presentation/slide.xml \
/path/to/presentation/slide_notes.md

python /home/ubuntu/skills/monthly-digital-assets-crypto-risk-outlook/scripts/c
/path/to/presentation/slide.xml
```

A successful command result is necessary but not sufficient. The render must still be inspected for layout balance, clipping and unreadable text.

## 8.3 Final delivery prompt

Plain Text

```
Complete final quality assurance. Confirm that every visible fact and chart val
```

Manus will present the slide as a downloadable card. Download PowerPoint or PDF from the card only after reviewing the rendered visual.

# 9. Revalidation, Correction and Rework Procedure

## 9.1 When a revalidation is required

Revalidate the slide when a reviewer questions the figures or wording, a source is corrected, an event post-mortem is published, a regulatory status changes, or a late disclosure alters the reporting-month picture.

## 9.2 Revalidation prompt

Plain Text

Revalidate every displayed data point, chart series and factual statement again

## 9.3 Correction log

Maintain a correction log inside the run manifest. Record the original wording, reason for correction, source basis, revised wording, affected artefacts and date of replacement.

| Date       | Slide item       | Original wording | Reason                             | Corrected wording      | Evidence reference |
|------------|------------------|------------------|------------------------------------|------------------------|--------------------|
| YYYY-MM-DD | Regulatory panel | Previous wording | Source did not establish the claim | Source-matched wording | Finding ID         |

# 10. Troubleshooting Guide

| Problem                            | Likely cause                                                       | Corrective action                                                                                                                  |
|------------------------------------|--------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| The slide has too much empty space | Panels are short or market charts are too small                    | Enlarge source-supported charts, increase panel copy within limits, use a full-height three-by-three grid and align column bottoms |
| Slide is crowded or unreadable     | Too many candidates retained or text was used instead of synthesis | Reduce to two or three central themes, move evidence detail into notes, use charts for data                                        |
| Proposal is presented as binding   | Regulatory status was not checked against primary source           | Change status to PROPOSAL or CONSULTATION ; remove claims about mandatory implementation                                           |

|                                                |                                                               |                                                                                                                                  |
|------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Large metric lacks basis                       | No raw data file or formula                                   | Remove metric or create raw-data pull, calculation record and note disclosure                                                    |
| A provider statement overstates wider impact   | Self-disclosure treated as independent evidence               | Identify it as provider disclosure; seek corroboration or reduce wording to source facts                                         |
| Empty chart or unexpected XML error            | Unsupported chart tag, malformed data or duplicate element ID | Read the PPTX authoring reference, correct syntax, rerun XML validation and render again                                         |
| Text overflows the slide                       | Text box too small, font too large or panel too dense         | Rewrite first; only then adjust box dimensions or use <code>autofit="shrink"</code> without dropping below readability threshold |
| Speaker notes are generic                      | Notes generated from slide summary rather than ledger         | Replace notes with the source register, metric definition, URLs, dates, limitations and prior-period correction record           |
| Firm-specific RAF statement cannot be defended | Internal limits or control evidence were not supplied         | Use <code>ASSESSMENT REQUIRED</code> ; request internal data separately                                                          |

## Appendix A. Reusable Monthly Prompt

Plain Text

```
/monthly-digital-assets-crypto-risk-outlook
/risk-committee-writing-controls
```

Run the Digital Assets & Crypto Risk Outlook for [START DATE] to [END DATE].

Scope: [SECTOR].

Geography: [GEOGRAPHY].

Output: one connected, 16:9 PowerPoint-compatible executive slide.

Evidence cut-off: [DATE, TIME, TIME ZONE].

Research market vital signs, operational and protocol incidents, illicit-financ

Use the approved three-column editorial slide structure: Market Vital Signs, Key Trends and Regulatory Mandates. Run language, visible-slide, chart, traceability and render quality checks before publishing.

# Appendix B. Reusable Prompt for Style Replication

Plain Text

Analyse the attached reference slide and create a short style-analysis file. Replicate the style of the reference slide in the output.

# Appendix C. Definition of Done

The run is complete only when every condition below is met.

| Condition                 | Completion criterion                                                                                          |
|---------------------------|---------------------------------------------------------------------------------------------------------------|
| Scope fixed               | Reporting window, cut-off, geography, sector and output are explicit                                          |
| Evidence retained         | Every visible fact has a source record and limitation                                                         |
| Data reproducible         | Every chart and metric can be recalculated from stored raw or transparent source data                         |
| Regulatory status correct | Every regulatory panel has correct visible status label                                                       |
| Content complete          | Title, 25-35 word conclusion, Market Vital Signs, Key Trends and Regulatory Mandates are present on one slide |
| Layout complete           | Three columns have comparable visual weight, no unused lower band and no unreadable content                   |
| Notes complete            | Internal evidence register, dates, URLs, chart definitions, limitations and corrections are included          |
| Controls passed           | Draft, slide XML and notes pass the language and visible-slide checks                                         |

|                     |                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------|
| Render passed       | The presentation opens cleanly and every element lies inside the canvas                   |
| Delivery controlled | Slide and supporting evidence files are delivered only after the above conditions are met |

**Final control.** A slide can be visually strong and still be unsuitable for use if a material number cannot be reproduced or a regulatory statement does not match its primary source. Evidence and reproducibility take precedence over slide completion.
