

February 2026 Cybersecurity Incidents

AB Volvo (Volvo Group): In February 2026, Volvo Group North America confirmed that a third-party breach exposed personal data of its employees. The intrusion occurred at Conduent (a workforce services provider) between October 2024 and January 2025. A Maine regulatory filing disclosed that 16,991 current and former U.S. employees had data (names and benefits records) accessed ¹. Volvo only learned of the exposure in late January 2026, a year after Conduent first detected the breach ². The exposed data were health-plan records and other HR files, and Volvo offered identity monitoring to affected employees ¹. (No direct evidence shows the stolen data were misused, but the breach highlights the risk of supply-chain attacks on vendors.)

LVMH (Louis Vuitton, Dior, Tiffany – South Korea): In mid-February 2026, South Korea's data protection authority announced stiff fines for three luxury brands owned by LVMH. Louis Vuitton was fined about **\$15 million**, Dior about **\$8.4 million**, and Tiffany about **\$1.6 million** for massive data breaches that had exposed millions of customer records ³ ⁴. The regulator said these breaches stemmed from a cyberattack on a third-party service (a SaaS platform used by the brands) and involved social-engineering on employees. In total, about 3.6 million records (Louis Vuitton) and 1.95 million (Dior) were compromised, mostly due to malware on an employee device or voice-phishing, and roughly 4,600 records at Tiffany ³ ⁴. (The fines were imposed in Feb 2026 under South Korea's Personal Information Protection Act for failures in securing customer data and employee devices.)

Saipem S.p.A. (Engineering/Construction): Saipem's security advisory in February 2026 warned of an active phishing campaign abusing the company's brand. The Italian energy contractor announced that fraudsters were sending spoofed emails purporting to be from Saipem employees, targeting Saipem's customers and partners ⁵. These fake emails used realistic sender names and malicious links, aiming to harvest login credentials from recipients ⁶. (Saipem did not report any internal systems being breached; rather, it issued this alert to caution that external parties should verify emails carefully, since the domain itself could not be trusted without additional checks ⁵.)

Other reported claims: BASF SE was listed on a ransomware leak site in early February 2026, but this claim appears unconfirmed. A dark-web posting on Feb 4, 2026 attributed BASF (the German chemicals giant) to the "0APT" ransomware group, but security researchers noted that listings by 0APT are often bogus or fabricated ⁷. The BASF posting gave no details on any encrypted systems or stolen files, and experts advise treating it as an unverified rumor ⁷. (In short, no official evidence of a BASF breach in Feb 2026 has emerged.)

Sources: Reports from industry and media detail the above incidents. Volvo's data exposure was disclosed via regulatory filings ¹, the LVMH brand fines were reported by SecurityWeek ³ ⁴, Saipem's advisory is on its official site ⁵, and the BASF claim comes from an unverified leak notice ⁷.
